

# Tips from the Lock Shop

Vol#2

## Stubborn Lock Cylinder nut.

Swapping key cylinders from one lock to another can be a common task for many facility lock techs. A common complaint is that the threads have been damaged or the factories lock tight make removing the cylinders very difficult. After receiving many requests for a tool to make removing the cylinders easier we here at Western Detention produced a cylinder specific wrench.

The WDPI cylinder nut wrench makes removing cylinders a breeze. No more using a chisel or screwdriver to slowly tap the ring loose (usually further damaging the threads). Now simply remove the covers off the locks and pop the ring loose with a nice ergonomic wrench.
